Mazes for Superintelligent

Ginzburg projection

Introduction

Let us take an example. We are given a uniform polyhedron.

small rhombidodecahedron

$$\left\{10, 4, \frac{10}{9}, \frac{4}{3}\right\}$$

In Mathematica the polyhedron is given by a list of faces and with a list of coordinates of vertices [Roman E. Maeder, The Mathematica Programmer II, Academic Press 1996]. The list of faces consists of a list of lists, where a face is represented by a list of vertices, which is given by a matrix. Let us show the first five faces:

```
{1, 2, 6, 15, 26, 36, 31, 19, 10, 3}
  {1, 3, 9, 4}
{1, 4, 11, 22, 29, 32, 30, 19, 13, 5}
  {1, 5, 8, 2}
{2, 8, 17, 26, 38, 39, 37, 28, 16, 7}
```

The next two figures represent faces and vertices. The polyhedron is projected onto a sphere and the sphere is projected by a cartographic projection.

The problem is to find the path from the black dot to gray dot, where thick lines represent walls of a maze.

The solution is given by a list of faces passed from the black to gray dot.
